Performance Comparison: LSTM vs BiLSTM - Accuracy & Loss

Metric	LSTM plot	BiLSTM plot
Training Accuracy	Steady increase, reaching ~ 0.85 by epoch 5	Faster and higher increase, reaching ~ 0.89
Validation Accuracy	Plateaus early at ~ 0.83	Slightly higher and more stable (~ 0.84 – 0.85)
Training Loss	Consistently decreases to ~ 0.35	Decreases faster, reaches ~ 0.26
Validation Loss	Smooth decrease, then plateaus (~ 0.37)	Slight fluctuations but overall lower (~ 0.34)

For LSTM

For BiLSTM

AUC Comparison:

- **BiLSTM shows a higher AUC value**, indicating **better discriminatory power** in distinguishing between the two classes compared to LSTM.

For BiLSTM

For LSTM

BiLSTM outperforms LSTM in terms of training accuracy, lower training/validation loss, and AUC.

Even though both models plateau in validation accuracy, BiLSTM starts at a higher value and exhibits more robust generalisation.

The **gap between training and validation loss** is narrower for BiLSTM, indicating **less overfitting** compared to LSTM.
